## Graph Quadratic Functions in Standard Form

**Goal** • Graph quadratic functions.

### Your Notes

#### VOCABULARY

Quadratic function

Parabola

Vertex

Axis of symmetry

Minimum and maximum value

#### PARENT FUNCTION FOR QUADRATIC FUNCTIONS

The parent function for the family of all quadratic functions is  $f(x) = \underline{\hspace{2cm}}$ . The graph is shown below.

The lowest or highest point on a parabola is the vertex. The vertex for  $f(x) = x^2$  is  $(0, 0)$ .

The axis of symmetry divides the parabola into mirror images and passes through the vertex.

For  $f(x) = ax^2$ , and for any quadratic function  $g(x) = ax^2 + bx + c$  where  $b = 0$ , the vertex lies on the            and the axis of symmetry is  $x = \underline{\hspace{2cm}}$ .

## Your Notes

### Example 1 Graph a function of the form $y = ax^2 + c$

Graph  $y = -2x^2 + 2$ . Compare the graph with the graph of  $y = x^2$ .

#### Solution

1. Make a table of values for  $y = -2x^2 + 2$ .

x	-2	-1	0	1	2
y	_____	_____	_____	_____	_____

Choose values of  $x$  on both sides of the axis of symmetry  $x = 0$ .

2. Plot the points from the table.

3. Draw a smooth \_\_\_\_\_ through the points.

4. Compare the graphs of  $y = -2x^2 + 2$  and  $y = x^2$ . Both graphs have the same \_\_\_\_\_. However, the graph of  $y = -2x^2 + 2$  opens \_\_\_\_\_ and is \_\_\_\_\_ than the graph of  $y = x^2$ . Also, its vertex is \_\_\_\_\_ units higher.

### PROPERTIES OF THE GRAPH OF $y = ax^2 + bx + c$

Characteristics of the graph of  $y = ax^2 + bx + c$ :

- The graph opens up if  $a$  \_\_\_ 0 and opens down if  $a$  \_\_\_ 0.
- The graph is narrower than the graph of  $y = x^2$  if  $|a|$  \_\_\_ 1 and wider if  $|a|$  \_\_\_ 1.
- The axis of symmetry is  $x =$  \_\_\_\_\_ and the vertex has x-coordinate \_\_\_\_\_.
- The y-intercept is \_\_\_\_\_. So, the point  $(0, \text{_____})$  is on the parabola.

## Your Notes

### Example 2 Graph a function of the form $y = ax^2 + bx + c$

Graph  $y = -x^2 + 4x - 3$ .

#### Solution

1. Identify the coefficients of the function. The coefficients are  $a = \underline{\hspace{1cm}}$ ,  $b = \underline{\hspace{1cm}}$ , and  $c = \underline{\hspace{1cm}}$ . Because  $a \underline{\hspace{1cm}} 0$ , the parabola opens  $\underline{\hspace{1cm}}$ .

2. Find the vertex. First, calculate the x-coordinate.

$$x = -\frac{b}{2a} = \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

Then find the y-coordinate.

$$y = \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

The vertex is  $(\underline{\hspace{1cm}}, \underline{\hspace{1cm}})$ . Plot this point.

3. Draw the axis of symmetry  $x = \underline{\hspace{1cm}}$ .

4. Identify the y-intercept  $c$ , which is  $\underline{\hspace{1cm}}$ .

Plot the point  $(0, \underline{\hspace{1cm}})$ . Then reflect this point in the axis of symmetry to plot another point  $(4, \underline{\hspace{1cm}})$ .

5. Evaluate the function for another value of  $x$ , such as  $x = 1$ .

$$y = \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

Plot the point  $(1, \underline{\hspace{1cm}})$  and its reflection  $(3, \underline{\hspace{1cm}})$  in the axis of symmetry.

6. Draw a parabola through the plotted points.

Be sure to include the negative sign before the fraction when calculating the x-coordinate of the vertex.

### MINIMUM AND MAXIMUM VALUES

**Words** For  $y = ax^2 + bx + c$ , the vertex's y-coordinate is the minimum value of the function if  $a \underline{\hspace{1cm}} 0$  and the maximum value if  $a \underline{\hspace{1cm}} 0$ .

$a$  is positive

$a$  is negative.

## Your Notes

### Example 3 Find the minimum or maximum value

Tell whether the function  $y = -3x^2 + 12x - 6$  has a *minimum value* or a *maximum value*. Then find the minimum or maximum value.

#### Solution

Because  $a$       0, the function has a                      value. To find it, calculate the coordinates of the vertex.

$$x = -\frac{b}{2a} = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

$$y = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

The maximum value is  $y =$      .

✔ **Checkpoint** Complete the following exercises.

Graph the function.

1.  $y = -x^2$

2.  $y = \frac{1}{3}x^2 + 3$

3. Graph the function. Label the vertex and axis of symmetry.

$$y = x^2 - 4x + 2$$

4. Find the minimum value of  $y = 2x^2 - 6x + 6$ .
