## "Specialty Parent Functions"

## 1. Constant Function

Describe a constant function: $\qquad$

Write a general equation for a constant function: $\qquad$

## 2. Linear Function <br> Describe the graph when $\boldsymbol{m}$ is positive:

Describe the graph when $\boldsymbol{m}$ is negative:

Describe what happens to the graph as $\boldsymbol{b}$ changes?

Under what conditions is a linear function called the Identity Function?

Sketch the Identity Function

Sketch $y=-2 x^{2}+4 x-5$

## 5. Square Root Function

Write the equation of the parent function. $\qquad$
What is the domain of the parent function? $\qquad$
What is the range of the parent function? $\qquad$
Sketch the parent function AND the function obtained when $\boldsymbol{a}=-1, \boldsymbol{b}=0$, and $\boldsymbol{c}=0$. Is this new sketch a function? Explain.

## 6. Cube Root Function and Rational Function

Which of these two functions (using the parents) has a domain covering all real numbers? Explain.

Which of these two functions (using the parents) has a range covering all real numbers? Explain.

## 7. Absolute Value Function

What is the range of the parent function? $\qquad$
Sketch $y=2|x-4|+3$. What is the range of this new sketch?

What value in the full form equation is affecting the range of the sketches? $\qquad$

## 8. Natural Log Function

The graph may appear to stop as it nears the y-axis. Zoom in by enlarging the grid. (Grab the red dot on the $x$-axis and drag.) Sketch the true graph of the parent function.

What it the domain of the parent function? $\qquad$
What is the range of the parent function? $\qquad$
Does the parent function have an inverse which is also a function? Explain. $\qquad$

9. Exponential Function

What is the domain of the parent function? $\qquad$ the range? $\qquad$
Does the parent function have an inverse which is also a function? Explain. $\qquad$

$\qquad$
Make a hypothesis as to which other function you have seen in this activity might be the inverse of the parent exponential function.
